

SharePoint Server 2013 Colour Calendar

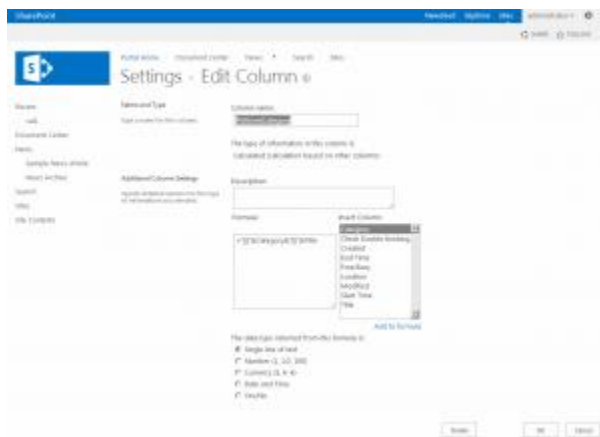

Resource: <http://www.planetwilson.co.uk/sharepoint-2013-colour-calendar>

I've had a few requests for this now SharePoint 2013 is fully released I have produced a script to colour code the calendars in SharePoint 2013. It should work with both Server and Foundation.

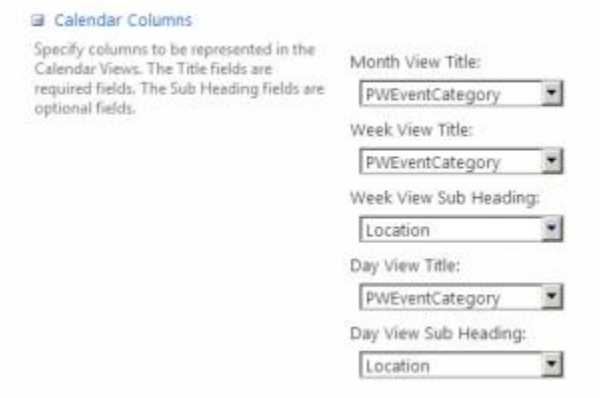

It is very similar to the 2010 version of the script with an updated script. The only change in the script is that the category names you choose must match exactly those in the script, the folding down to lower case in the 2010 script caused more support issues that it was worth.

1) So let's begin, first of all create a calendar and go into the settings page and add a new calculated field called CategoryTitle with the formula:

= "|||" & [Category] & "|||" & [Title]

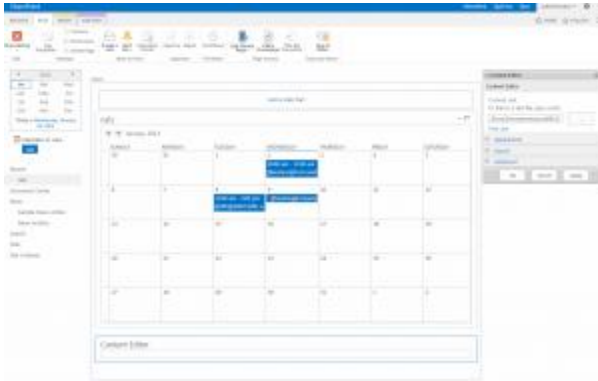

2) Set the Month View, Week View and Day View under the "Calendar" view settings to be the new CategoryTitle field.

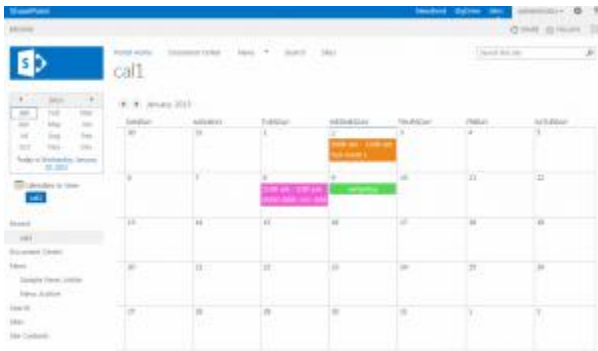

3) Upload a text file containing the following content to a document library. In this case I have created pwcal2013.txt. Download the script as a as a txt file [here](#) or Word document [here](#). Office 365 users, use this [link](#).

Please note that you may have issues with the script if you site is on HTTPS/SSL. If so then you can change the referenced JQuery URL in the script to be `https://ajax.aspnetcdn.com` instead of `http`. If you have a mixed environment where some users access over `https://url1` and some over `http://url2` then you will need to switch to a locally held copy of the JQuery library. Upload it to a document library somewhere and change the link to that.

4) On the calendar page itself, edit the page and add a Content Editor WebPart. In the CEWP settings, set the content link to the url of the newly uploaded text file, click the test link to ensure that the url is correct (i.e. it downloads the file)

5) Save the webpart properties and refresh the calendar. Create some entries and apply a category to them, you should hopefully see the calendar coloured.
